SOWsmith

Grounded SOW/RFP Bid-Package Agent

Turns rough project notes into a polished, house-style SOW/RFP in minutes — grounded in approved documents via Foundry IQ (cited, no hallucination), with legal-review routing and human approval.

What it is

WHAT

A **Microsoft 365 Copilot** agent (Copilot Studio) that converts a few sentences of project notes into a polished, house-style **seven-section SOW or RFP** — grounded in the organization's own approved bid packages, **cited and with no invented numbers** — then routes **every draft through human approval** with a full audit trail.

THE PROBLEM

Producing bid packages is slow, inconsistent, and risky: scope drifts, exclusions are missed, and non-standard commercial/legal terms slip through without review.

MICROSOFT IQ — FOUNDRY IQ

Generation is grounded through **Foundry IQ**: agentic, permission-aware retrieval over the approved-exemplar and clause libraries, returning **cited** context so the agent copies real house standards instead of hallucinating.

Days → ~2 hours	Turnaround per bid package
100% structure / footer / legal-routing	On the 10-intent evaluation vs the live model
\$0 tokens	Structure, routing, validation & bid scoring are deterministic
A human approves every package	The agent drafts; people decide; non-standard terms → Legal

The governed lifecycle (multi-step reasoning)

- **1 · Collect intent** — service type, SOW/RFP, project notes.
- **2 · Retrieve** grounded exemplars via Foundry IQ.
- **3 · Draft** the seven-section package in house style; carry domain terms verbatim; bracket missing values instead of inventing.
- **4 · Detect** non-standard commercial/legal terms → flag **LEGAL REVIEW REQUIRED**.
- **5 · Save** an editable Word document to SharePoint with routing metadata.
- **6 · Approve** — synchronized **email + Microsoft Teams** approval; a human Approves/Rejects.
- **7 · Route & log** — move to Approved/Rejected and write an audit-log entry.

Why it wins on Reliability & Safety

- **Deterministic core (\$0 tokens, no hallucination)**: structure, legal-routing, validation and audit are code; the LLM writes only the prose (one call per draft).
- **Anti-hallucination**: the prompt forbids inventing prices/quantities and renaming domain terms; a validator scans every draft for invented numbers and speculative sentences.
- **Explainable**: every Q&A answer is cited; every LEGAL flag states why; recorded in the audit log.
- **Human-in-the-loop**: a human approves every package; the agent refuses improper requests (invent prices, waive liability, bypass review).

Close on

“Grounded in our own approved packages with Foundry IQ, a human approves every one, days become hours, and non-standard commercial terms route to Legal automatically.”
